Temperature-resistant belts

Machine and process belts

Special belts (to customers' specifications)

Conveyor belts for paper transport and paper handling

Coating materials for timing belts and Multi-V belts

Performance

For over 50 years Max Schlatterer GmbH & Co. KG have been developing and manufacturing endless belts – drive belts, conveyor belts, belts made to customers' requirements – in two factories in southern Germany. We actively contribute in the entire world to the development of innovative production plants, supply convincing band and belt designs, we realize these ideas on equipment developed by our own specialized personnel and supply 100% quality by using electronic testing equipment. We are partners to significant companies in many different industries. And in the cigarette industry we are thus far ahead of our competitors.

Advantage

Schlatterer supply endless belts in all sizes up to a length of 4,800 mm and a width of 600 mm. Special sizes are available upon request. Due to our specific production techniques and production equipment, Esband products are unique. Intensive research and development in close co-operation with the machine manufacturers constantly produce new, innovative bands and belts. They provide our customers with a competitive edge and offer a high degree of security for their production processes, based on superior characteristics over the entire belt length.

Philosophy

Where demands are high, the Endless Schlatterer Belt (Esband) convinces. They are manufactured according to our truly endless method without a single seam or splice. Thus, Esband is absolutely reliable and durable even at high speeds and in complicated environments.

Many of our Esband drive belts, conveyor belts and special belts have been patented. A wide variety of basic materials and surface treatments guarantee the perfect belt for every application. A comprehensive marketing and service network in over 80 countries world-wide ensures a close co-operation with our customers.

About us

Development

A good fifty years ago, the vision of frictionless production processes inspire the belt maker Max Schlatterer with an ingenious idea: He manufactures a ring-shaped, woven, endless drive and conveyor belt without beginning or end and without any joints. Its advantages in terms of performance, flexibility and durability prove to be enormous.

Schlatterer recognizes the far-reaching significance of his invention, registers the patent, generates lively interest and achieves his first successes.

High-performance materials constantly lead to further refinements. Fame and commercial importance grow. Small at the outset, the enterprise develops rapidly. In the 1960s Schlatterer employs 140 people in the Swabian town of Herbrechtlingen. By the 1980s this figure has increased to more than 300. And already at an early stage, he begins to invest in environmentally friendly methods of production.

Today over 600 highly motivated employees in two closely located production sites covering a total area of 20,000 m² strive for further growth. A superior product range, great enthusiasm for innovation and highest, electronically controlled product quality have made Schlatterer GmbH & Co. KG one of the most efficient and significant belt manufactures throughout the world.

Endless

Endless advantages

The Esband brand name is applied exclusively to flat belts and conveyor belts made utilizing a genuinely endless technique. Made with no joints or splices, they offer countless advantages:

endless homogenisation

Esband offers uniform elongation values, tear resistances and thickness tolerances over the complete length – weak points are eliminated.

endless flexibility

Esband functions even over the smallest bending radii, frequent bending changes and over knife edges with absolute reliability.

endless quiet running

Esband totally avoids noise pulses that would otherwise be generated by joints and runs absolutely quietly.

endless care

Esband is bipolar: Low longitudinal elongation and transverse adaptability endow it with small initial tensioning forces and low shaft loads.

endless precision adaptability

Esband provides for individually matched carcass materials and coatings for economically viable production processes.

Schlatterer customers profit from intensive consultation, precise belt calculation and individual support.

Esband belts produced according to the truly endless method make your production process run smoothly: Precise tracking, low-vibration, low noise levels, durable – even at high rotary speeds and bending frequencies.

1. Open Belt Drives

- Flexible power transmission with low shaft loads and reduced wear
- Transmittable power of up to 60 kW (special purpose belts up to 150 kW)
- Temperature resistant up to 130°C
- Absorption of shock and vibration
- Suitable as overload protection
- High reliability

2. 90° Turn Belt Drives

- Easy design possibilities with non-parallel rotary axes

3. Cross Belt Drives / Half-Cross Belt Drives

- Easy design possibilities with changes in the direction of rotation

4. Multi-Shaft Drives

- Torque reduction drives with long service life at high bending frequencies

5. Spindle Drives

- Spindle conveyors and tangential belts used in the textile industry
- Suitable for smallest bending radii and high belt speeds

Light-Duty Drives – up to approx. 2.5 kW

Extremely wear resistant belts with superior running and traction properties, high flexibility, precisely coordinated coefficients of friction, antistatic. Typical applications:

- High-speed drives
- Office equipment
- Household appliances and do-it-yourself equipment
- Grinders
- Saws
- Testing equipment
- Spindle drives
- Spinning frames
- Bobbin machines
- Textile machinery

Medium-Duty Drives – up to approx. 15 kW

Extremely wear resistant belts with superior running and traction properties, low noise operation, low

elongation, antistatic. Typical applications:

- High-speed drives
- Woodworking machinery
- Floor maintenance equipment
- Do-it-yourself equipment
- Grinders
- Machine tools
- Textile machinery
- Construction equipment
- Low humidity atmospheres

Heavy-Duty drives – up to approx. 60 kW

Extremely wear resistant belts with good traction properties, running neutrality, limited elongation. Typical applications:

- Especially for balancing machines
- Construction machinery
- Eccentric presses
- Woodworking machinery
- Ventilation fan drives
- Grinding gear
- Motor testing rigs
- Turbine drives
- Hydro-electric stations
- Mills
- Testing equipment

Esband conveyor belts produced according to the truly endless method enable frictionless processes. Each category of goods transported requires a specific type of band; each environment makes its specific demands. The following list includes the most important fields of application:

Paper

For paper processing and paper handling Esband offers bands with various degrees of elasticity, high ozone-resistance, high breaking strength or low elongation, based on your requirements. Typical applications: Printing machines, copiers and scanners, cash dispensing and ticket issuing

machines, paper and cardboard processing machines.

Food Transport

Esband enables delicate processing and packaging of food. Our belts are FDA/BGA approved, easy to clean, temperature resistant with varying degrees of elasticity and flexibility and various coefficients of friction. Typical applications: knife edges, transfer stations, automatic packaging machines, cheese-making machines, bakery lines.

Weighing Technology

Esband brings weighing technology to peak perfection as our belts are truly homogeneous over their entire length (including weight), with exactly adapted coating and elongation characteristics, special surface finishes and low-friction covers on the running side. Typical applications: For light-weight bulk materials and unit goods, dynamic weighing devices, knife edges, small bending radii.

Transport

Bulk Material and Unit Goods

Esband transports every kind of unit goods and bulk material of all weight categories to perfection as our belts have exactly matched coefficients of friction, ideal elongation characteristics, self-tracking guides, perforations for vacuum transport, etc. Typical applications: Fixed shaft centre distances, knife edges, slider beds, vacuum transport.

Special Conveyor Belts

Esband supplies conveyor belts with special surface treatments for conveying of unit goods and bulk materials under extreme conditions. Typical applications: Sharp ascent angles, highest temperatures, inclined feeder conveyors, synchronous and/or vacuum transport.

Carcass Materials

We produce our Schlatterer special fabric in endless form on modern knitting machines. It is the base of each treatment, coating and refinement process.

Depending upon the carcass material, belts with specific properties are produced.

1. Schlatterer Special Fabric

is manufactured in endless form on the most modern knitting machines.

Elastic yarn

- High elastic elongation from 4 – 10%
- For fixed shaft centre distances
- No tensioning device necessary

Polyamide

- Medium elastic elongation from 0.5 – 1.5%
- For fixed shaft centre distances

Polyester

- Low elastic elongation
- Resistant to chemicals

Cotton yarn

- Low elongation
- Low coefficient of friction

Aramide

- Extremely low elongation
- Low coefficient of friction
- Temperature-resistant up to 280°C

Nomex

- Low elongation
- Temperature-resistant up to 300°C

Glass fibre

- Low elongation
- Low coefficient of friction
- Temperature-resistant up to 300°C

2. Timing belts, Multi-V belts

provided by our customers are coated with Polyurethane or Neoprene on the back, without joints or splices.

The resistance of the carcass fabric to chemical influences varies as follows:

Aggressive medium	Carcass				
	Polyester	Cotton	Aramide	Nomex	Glass fibre
Water	+	+	+	+	+
Oils, grease	+	○	+	+	+
Diluted acids	+	+	+	+	+
Diluted bases	+	+	+	+	+
Aromatics	+	+	+	+	+
Alcohol	+	+	+	+	+
Aliphatic compounds	+	+	+	+	+
Chlorinated hydrocarb.	+	+	+	+	+
Ketones	+	+	+	+	+
Dimensional stability					
at high humidity	+	-	+	+	+
With highly fluctuating temperatures	+	+	+	+	+

High = +
 Medium = ○
 Low = -

All Esband coatings are applied as an endless cover; you can thus specify the running direction of the belt yourself. We coat flat belts, timing belts and Multi-V belts. You can also order small batches at reasonable prices in the sizes you require.

According to your application, we recommend the following coating material:

Polyurethane

- Foamed (yellow, grey, white, red)
- Compact (white, FDA)
- Temperature-resistant up to 60°C (short-term up to 80°C)
- Good coefficient of friction to paper
- Different hardness versions available
- Thickness up to max. 10 mm

Natural Rubber

- Red (hardness approx. 42° ShA)
- Maroon (hardness approx. 50° ShA)
- Extremely high coefficient of friction
- Temperature-resistant up to 70°C
- High elasticity
- High resistance to tear propagation

Neoprene Rubber

- Black
- Hardness approx. 75°ShA
- High resistance to abrasion
- High coefficient of friction
- Good wear resistance to oils, grease, ozone
- Temperature-resistant up to 100°C
- very flexible
- Electrically conductive

NBR Rubber

- Light grey, blue, white
- High resistance to abrasion
- High coefficient of friction
- Very good resistance to

oils and grease

- Temperature-resistant up to 100°C
- BGA/FDA-approved (white)

xNBR Rubber

- Off-white
- Hardness approx. 75°ShA
- Extremely high resistance to abrasion
- Good coefficient of friction
- Good resistance to ozone
- extremely good resistance to oils and grease
- Temperature-resistant up to 130°C

Silicones

- White, grey
- Hardness approx. 30 – 35° ShA
- Thickness up to 10 mm possible
- Temperature-resistant up to 280°C
- High coefficient of friction
- Stain-resistant
- BGA/FDA approved
- Easy to clean when contaminated with adhesives

PVC

- Red
- Temperature-resistant up to 60°C
- Good resistance to chemical

EPDM

- Green
- Hardness approx. 65°ShA
- Very durable in extreme climates
- Temperature-resistant up to 80°C
- High coefficient of friction

The resistance to chemical influences is as follows:

Aggressive medium	Coating						
	Neoprene (NE)	Polyurethane (PU)	Silicone (SI)	Natural Rubber (NR)	NBR/xNBR	EPDM-Rubber	PVC
Water	+	○	+	+	+	+	+
Oils, greases	○	+	○	-	+	-	○
Diluted acids	+	-	○	+	+	+	+
Diluted bases	+	-	○	+	○	+	+
Aromatics	-	○	-	-	○	-	-
Alcohol	+	○	+	+	+	+	○
Aliphatic compounds	+	+	○	-	+	-	+
Chlorinated hydrocarbon	○	○	-	-	○	-	-
Ketones	+	-	-	-	○	+	-

Coefficient of Friction

The combination of different coating materials and surface designs on the running side and outside of the belt allow different solutions tailored to the specific application with special physical and chemical properties. And we offer nearly every combination of different coating materials.

Coefficients of friction in cleaned, brand new condition

Measured in compliance with German standard MSN 93 602 on ground or smooth surfaces. All figures are in $\mu \pm 0.1 \mu$

Special processing

An Esband is always a belt made exactly to your requirements in endless form.

For further processing we employ a computer-controlled five-axis machine. This in-house development permits perforations and recesses in almost any shape (e.g., for suction slots or transporting bags).

Following just a few examples out of a programme of endless possibilities:

Fig. 1

Flat belts with self-tracking guides as guide wedges glued onto the running side or milled out of solid material.

Fig. 2

Flat belts with self-tracking guides as guide flanges glued onto the running side or milled out of solid material.

Fig. 3 + 4

Flat belts perforated with standard 1.5 - 10.0 mm diameter holes. Perforation pattern to customers' requirements. Special diameters on request.

Fig. 5

Flat belts with extra-thick coating on conveying side and incorporated suction slots and suction holes for vacuum transport with increased suction surface area.

Fig. 6

NE and PU timing belts with coating on the back and incorporated suction slots and suction holes as well as a suction channel milled into the tooth side of the belt, e.g., suction belt for packing machines for bags.

Fig. 7

Multi-V belt with coating on the back.

* The standard hardness of PU coating is approx. 55° Shore A.

The following options are possible:

PU red hard = approx. 70° ± 7° Shore A

PU grey hard = approx. 70° ± 7° Shore A

PU yellow soft = approx. 30° ± 7° Shore A

Altering the surface also means altering the coefficient of friction, thickness and thickness tolerances.

** Other dimensions and tolerances available on request.

Length tolerances below ± 2.5 mm not possible.

Foamed Polyurethane (PU)

Colours: Yellow, grey, white, red

**Temperature-resistant up to 60°C,
short-term up to 80°C**

**Very good coefficient of friction
against paper**

Different hardness versions possible

Thickness up to max. 10 mm possible

Non-porous finish

**Colours: Yellow, black, white, red,
grey**

Stain-resistant and easier to clean

**Reduced coefficient of friction possible
(non-porous ply SL)**

* Other dimensions and tolerances available on request.

Length tolerances below ± 2.5 mm not possible.

Neoprene Rubber

Black, electrically conductive

Temperature-resistant up to 100°C

Hardness approx. 75° ShA

High coefficient of friction

High resistance to abrasion

Good resistance to oils, grease, ozone

Flexible

Natural Rubber

Red (hardness approx. 42° ShA)

Maroon (hardness approx. 50° ShA)

Temperature-resistant up to 70°C

Extremely high coefficient of friction

Highly elastic

High resistance to tear propagation

NBR Rubber

Light grey, blue, white

FDA/BGA approved (white only)

Temperature-resistant up to 100°C

High resistance to abrasion:
hardness approx. 70° ShA

Resistant to ozone

Extremely good resistance to
oils and grease

xNBR Rubber

Off-white

Hardness approx. 75° ShA

Temperature-resistant up to 130°C

Good coefficient of friction

Extremely high resistance to abrasion

Resistant to ozone

Extremely good resistance to
oils and grease

EPDM

Green

Hardness approx. 65° ShA

Very durable in extreme climates

Temperature-resistant up to 80°C

Good coefficient of friction

Only available as elastic belt without
carcass and as coating on timing belts

Compact Polyurethane (FX)

White, hardness approx. 80° ShA

Only available in certain thicknesses

FDA/BGA approved

Temperature-resistant up to 80°C

Surface smooth, ground or profiled

Silicone

White, grey

Hardness approx. 30° – 35° ShA

Temperature-resistant up to 280°C

High coefficient of friction

Stain-resistant, resistant to chemicals

FDA/BGA approved

Thickness up to 10 mm possible

PVC

Red

Temperature-resistant up to 60°C

Resistant to chemicals

Resistant to microbes

Technical Data

Esband creates endless design possibilities. When you are a designer or machine manufacturer we can give you useful information on pulley designs, design of the belt drive, arrangement of tensioning pulleys, placement of tensioning rollers and special drive forms.

1. Guiding of the Flat Belt by Crowned Pulleys

Design of pulley depending on belt width b

b [mm]	b_s [mm]	h [mm]	r_s [mm]
10	13	0,3	71
13	16	0,3	107
16	20	0,3	167
20	25	0,3	261
25	32	0,3	427
32	40	0,4	500
40	50	0,4	782
50	63	0,4	1241
63	80	0,4	2000
80	100	0,5	2500
100	125	0,5	3907
125	160	0,6	5334
160	200	0,7	7143
200	250	0,8	9766

Textile flat belts run with a very high degree of directional stability. To ensure optimum belt guidance at least one of the pulleys should be crowned. The remaining pulleys may then be cylindrically shaped.

In case of limited production possibilities or large pulley widths, one of the other illustrated crown forms may be chosen.

Important note: To achieve optimum service life of the belt, pulleys which rotate in the same direction should be designed with a crown.

When pulleys are mounted in a parallel way and conventional drive conditions exist, lower values than the given ones for crown height may be chosen.

Recommended materials: Steel, grey cast iron or aluminium in ground or fine-ground form ($R_a = 3.2 \mu\text{m} / R_z = 16 \mu\text{m}$ or $R_a = 1.6 \mu\text{m} / R_z = 6.3 \mu\text{m}$).

We reserve the right to amend the specified values to reflect the latest state of the art.

General advantages of flat belts

Extremely high efficiency (>98.5%)

High belt speeds up to 150 m/s (low mass-centrifugal forces up to 20 m/s can be disregarded)

Machine elements in wide variety (surfaces, materials, elongation)

Long service life

Many designs and specific solutions possible

High power density (30 kW/cm, depending upon belt speed)

Very good dynamic properties (quiet running, precise tracking)

Freedom in design - simplified design

Better shock attenuation and shock absorption

Use as overload protection for expensive machine components.

Designs of the crown for guiding pulleys

Slightly crowned

Trapezoidal crown

Slightly crowned with shoulders (shoulders without guide tasks)

Calculations

1. Calculations for standard drives on the basis of an example:

These calculations assume the following data:

- P = 7.5 kW
- d1 = 140 mm
- n1 = 2900 rpm
- d2 = 52 mm
- Number of pulleys z = 2
- Shaft centre distance e = 165 mm
- Belt type chosen = NE22
- Coefficient of friction = 0.5 μ
- Duty factor CB = 0.9

1.1 Belt length L =

$$2 * e + \frac{\pi}{2} (d2+d1) + \frac{(d2-d1)^2}{4 * e} = 643 \text{ mm}$$

1.2 Belt speed v =

$$\frac{d1 * n1}{19100} = 21,26 \text{ m/s}$$

1.3 Bending frequency f_B =

$$1000 * z * \frac{v}{L} = 66 \text{ 1/s}$$

Comparisons in the table showing the smallest pulley diameter.

1.4 Arc of contact β =

$$180 - \frac{60 * |d1-d2|}{e} = 148^\circ$$

1.5 Specific rated power P_N

According to diagram:
2.3 kW per cm of belt width

1.6 Belt width b =

$$\frac{10 * P}{C_B * P_N} = 36,2 \text{ mm} = 40 \text{ mm}$$

1.7 Strand force ratio m =

$$\text{(Euler's number)} \mu^{\widehat{\beta}} = 3.64$$

1.8 Minimum pre-tension F_v =

$$\frac{m+1}{m-1} * \frac{500 * P}{v} + \frac{1,21 * b * v^2}{1000} = 331,9 \text{ N}$$

1.9 Shaft force at idle F_w =

$$2 * F_v * \sin \frac{\beta}{2} = 638,1 \text{ N}$$

1.10 Suggested text when placing an order:

Esband NE 22; 643 x 40 mm, or closest stock dimension = 650 x 40 mm

2. Selecting the duty factor C_B

1.0

Steady operation, small mass to be accelerated

0.9

Almost steady operation, medium mass to be accelerated

0.75

Non-steady operation, medium mass to be accelerated

0.65

Non-steady operation, large mass to be accelerated, heavy shocks

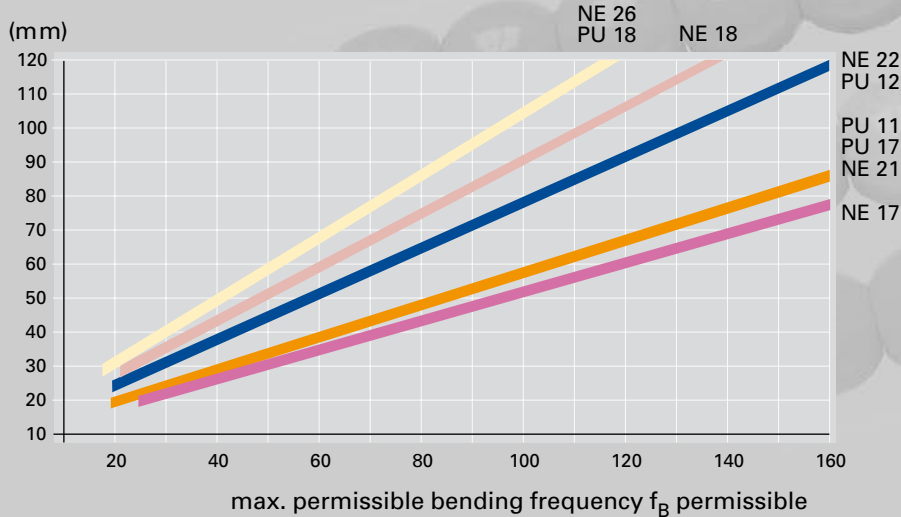

3. Relation between transmittable power and belt speed

4. Determining the bending frequency

Guide values for maximum bending frequency and minimum pulley diameter for endless Schlatterer drive belts with standard thickness.

Pulley diameter

Ground NE belt and PU belts, the latter coated on both sides
 f_B permissible = 15% less

5. Equations for special forms of drive

Cross belt drive

Determining the shaft centre distance:

$$\acute{e}/ab \geq 20$$

Calculating the belt length:

$$L = 4 \cdot \acute{e} + \frac{\pi}{2} (d_1 + d_2) + \frac{(d_1 + d_2)^2}{8 \cdot \acute{e}}$$

Half-cross belt drive

Determining the shaft centre distance:

$$\acute{e}/ab \geq 20$$

Calculating the belt length:

$$L = 2 \cdot \acute{e} + \frac{\pi}{2} (d_1 + d_2) + \frac{d_1^2 + d_2^2}{4 \cdot \acute{e}}$$

90° turn belt drive

Determining the shaft centre distance:

$$\acute{e}/ab \geq 20$$

Calculating the belt length:

$$L = 4 \cdot \acute{e} + \frac{\pi}{2} (d_1 + d_2 + d_3) + \frac{d_1^2 + d_2^2}{8 \cdot \acute{e}}$$

For Designers

Fig. 1

Fig. 2

recommended

not recommended

2. Design of the belt drive with crowned/cylindrical pulleys

With gearing ratios exceeding 1:3 and horizontal shafts, the crown of the small pulley may be cylindrical. In the case of drives with vertical shafts we recommend to crown both pulleys (see Fig. 1).

For multi-shaft belt drives the pulleys with the biggest diameter and rotating in the same sense must be crowned (see Fig. 2).

3. Arrangement of tensioning rollers

When using tensioning rollers the following items must be observed:

- The diameter of the tensioning roller should be selected as large as possible
- The tensioning roller should always be in the slack side of the drive
- The tensioning roller should always be cylindrical
- The necessary pre-tension can be applied by using tensioning rollers, motor-driven rocker dolly switch, eccentric, spring tension or the inherent elasticity of the belt.

Knife edge

Vacuum box

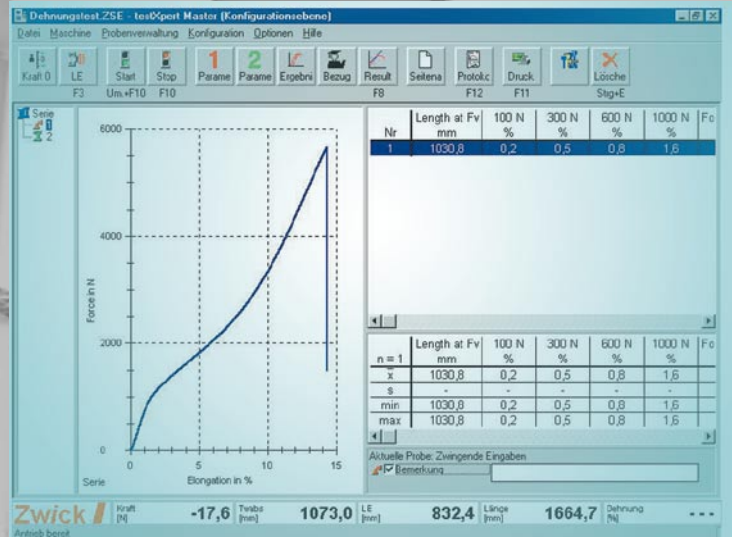

Checkweigher

Properties of conveyor belts for applications on the left hand side

- Low coefficient of friction on running side
- Belt thickness as thin as possible (especially knife edges and weighing belts)
- If necessary, increase coefficient of friction on the pulley (rubber coating on pulley)
- Type of goods to be transported (food)
- Resistance to chemicals
- Antistatic (carcass)
- Self-tracking guide with guide wedges (not for knife edges!)

Quality Assurance

In-house, multi-purpose testing equipment enables Schlatterer to ensure precise quality inspection and assurance. We test all Esband belts and bands according to our own strict testing standards for the following properties:

1. Product length

Examination of the elongation characteristics at LO (manufacturing length) and L1 (installed length), as well as at defined tractive forces both in the production line and in the laboratory on Universal testing machines.

2. Product thickness

Inspection by means of high-quality micrometer instruments for production and by inductive sensors with pneumatically applied force for quality assurance.

3. Dynamic testing of running properties

Computer-controlled dynamic belt test rig with optical sensors for automatic measuring of width, lateral movement and centric running accuracy.

4. Static measuring of coefficient of friction

Determination of the coefficient of friction of drive belt or conveyor belt to any material chosen.

Sketch:

5. Breaking strength and elongation at breaking point

Determination of breaking strength (tensile force) and elongation at breaking point of flat belts and conveyor belts on Universal testing machines.

Comparison of the individual values of different belt types.

6. Endurance test / Frequent bending alterations

Determination of bending alteration ratio, i.e. influences on breaking strength, coefficient of friction, length, elongation and on the coating of the belt and conveyor belt in long-term tests.

7. Rheostat of flat belts

Determining the resistance to electric flow R_D of belts and the electrical surface resistance R_0 based on German Industrial Standard DIN 53482.

8. Abrasion of coating materials for flat belts

Comparison of the abrasion (abrasive behaviour) of coating materials for flat belts and conveyor belts against abrasion-induced wear (based on German Industrial Standard DIN 53516).

9. Testing of hardness of Shore A and Shore D

Determining the hardness of test pieces made of elastomers and rubbers based on German Industrial Standard DIN 53505.

10. Special tests

According to our customers' requirements, we conduct additional tests on product properties. In order to be able to do this, we are constantly developing new testing procedures.
